**GENERIC APPLICATION FLOW MANAGEMENT
SYSTEM AND METHOD**

Abstract

A generic application flow management system and method according to which an import module imports an object and an application builder having a graphical interface displays the object as icons. The icons are capable of being positioned relative to each other. A generation module generates a script using the object represented by the first icon and the object represented by the second icon, wherein the relative position of the first icon to the second icon indicates the flow of the script.
